

TEST SUMMARY REPORT — CampusKart (campuskart.site)

Author: Kamsi Nwogu

Test cycle: 10th September 2026 to 17th September 2026

Devices: HP EliteBook (Windows 11), Redmi Note 13 (Android)

Browsers: Chrome, Edge, Firefox (desktop); Chrome for Android (mobile)

Network: Glo mobile data and Wi-Fi

1. Test Case Results

Metric	Count
Total test cases written	80
Passed	57
Failed	13
Blocked	10
Total executed	80

Coverage across modules (10):

Buyer Auth · Seller Auth & Dashboard · Rider Portal · Products, Categories, Search, Filters · Cart & Checkout · Wallet & Payment · Messaging · Help, Contact, Support · Navigation, Footer, Terms, Privacy · Responsive Layout.

Test type split:

42 positive, 20 negative, 18 edge cases. Negative and edge cases together total 38

The 10 Blocked rows (TC-025, TC-036, TC-037, TC-052, TC-067, TC-068, TC-069, TC-070, TC-071, TC-072) were blocked by prerequisites that did not exist on the live site — a deleted listing, an out-of-stock item, and a contact/support form. They are listed here as coverage gaps rather than defects.

2. Defects by Severity

Severity	Count	Bug IDs
Critical	1	BUG-001
High	1	BUG-005

Medium	6	BUG-002, BUG-003, BUG-004, BUG-006, BUG-008, BUG-009
Low	2	BUG-007, BUG-010
Total	10	

Defects by Module

Module	Bugs	Severity range
Buyer Auth / Session	2	Critical, Medium
Cart & Checkout	2	High, Medium
Rider Portal	2	Medium
Authentication / Role separation	1	Medium
Messaging	1	Medium
Products & Filters	1	Medium
Console / PWA	1	Medium
Navigation / Footer	1	Low
Buyer navigation bar	1	Low

The pattern is worth noting: the three highest-severity bugs (BUG-001, BUG-005, BUG-004) all sit at state boundaries — the moment between logout and the previous page, the moment between order confirmation and the browser Back button, and the boundary between roles. Every one of them breaks because something that should have been reset, cleared, or verified was not.

3. Riskiest Areas of the Product

a. Session management — highest risk.

BUG-001 proves the session is not cleared on logout. This is the single most serious finding in the cycle because it affects every user on every device and exposes account content with one press of the Back button. It is also the class of defect most likely to have siblings — if logout does not clear state, other session boundaries (password reset, expiry, multi-device login) may be equally weak.

b. Checkout and order placement — second-highest risk.

BUG-005 shows the order can be placed twice by pressing Back. On a marketplace where sellers ship physical goods and buyers may be charged, a duplicate order is a

money-losing defect. Every re-submission path, refresh during checkout, and network interruption during payment is a place this bug could repeat.

c. **Role boundaries — third-highest risk.**

BUG-004 shows rider and seller accounts reaching the buyer area without registration. The buyer area is low privilege, so the direct damage is limited, but the finding points at a broader pattern: the product does not enforce which role can reach which area. If the same weakness exists in the other direction — a buyer reaching the seller or rider's dashboard — the impact would be higher.

d. **Console noise.**

BUG-009 (manifest.json 404 on every page load) is Medium, but its presence means the Console is not a reliable place to spot new errors — genuine ones will be buried under known noise. That hurts the next tester as much as it hurts the user.

e. **Mobile rendering consistency.**

BUG-010 (buyer profile icon missing) is Low on its own, but it shows the buyer's view does not match the seller and rider's views in the shared navigation bar. Anywhere the buyer view diverges from the others is worth a second look.

4. Release Verdict

Do not ship this release as it stands. One Critical defect must be fixed first, the session is not cleared after logout, leaving the previous authenticated page reachable with the Back button , and one High defect — the Back button after checkout re-placing an order — must be fixed in the same release because of the duplicate-charge risk. The remaining eight defects are Medium or Low and can be scheduled into a follow-up sprint without blocking release.

Fix order: BUG-001 → BUG-005 → BUG-004 → the remaining Mediums → the two Lows.

5. What I Would Test Next with Another Week

Session and authentication boundaries .

Password reset, session expiry after long idle, multi-device login, concurrent sessions, and the behavior of every protected route after logging out. BUG-001 found one hole; a full pass would find the rest.

Checkout and payment integrity.

Every path that could charge or recharge: refresh mid-checkout, duplicate taps, network drop

during payment, back and forward navigation through the payment step, and wallet debits versus order totals. BUG-005 proves that the class exists.

Role boundary audit.

Every menu item and URL for buyer, seller, and rider, accessed deliberately from each of the other two roles. BUG-004 only scratched the surface.

Accessibility basics.

Keyboard-only navigation, visible focus states, alt text on product images, and colour contrast on the yellow-on-dark theme. Not started in this cycle.

File upload and image handling.

Only the rejection path (non-image file) was tested. Not tested: large images, wrong aspect ratios, filenames with special characters, and slow uploads interrupted mid-way.

Conclusion

Ten defects found across ten modules in one day, with full reproduction steps, severity and priority separately justified, and an evidence pack for everyone. The product is close to usable but not releasable — the two navigation-and-session defects would reach real users, and both should be closed before the next release.
